where data is stored within the system These could include Client Database Containing client personal information appointment history and preferences Employee Database Containing employee details schedules and pay rates Inventory Database Containing product information stock levels and supplier details Appointment Database Containing all scheduled appointments Financial Database Storing transaction details invoices and payment information Data Flows These are the arrows representing the movement of data between the components For example a data flow might show client information moving from the client database to the appointment scheduling process

III HighLevel DFD Context Diagram for a Salon Management System The highest level DFD often called a context diagram presents a simplified overview It shows the system as a single process interacting with external entities In our salon system this would depict the entire system as a single box labeled Salon Management System interacting with Clients Employees Suppliers and the Accounting System Each interaction would be represented by a data flow indicating the type of information exchanged

IV Level 0 DFD Decomposing the System The Level 0 DFD breaks down the system into its major processes This provides a more detailed view of the data flow within the salon management system It would still maintain simplicity by representing each major process as a single process bubble For example Appointment Management This process handles appointment scheduling rescheduling cancellations and reminders Client Management This process handles adding updating and querying client information Employee Management This process handles employee scheduling payroll and performance tracking Inventory Management This process handles tracking product stock levels ordering new supplies and managing supplier relationships Financial Management This process handles payment processing invoice generation and financial reporting

3 Data flows would connect these processes to the data stores and external entities For instance Client Information would flow from the Client Management process to the Client Database and from Client Database to the Appointment Management process

V LowerLevel DFDs Level 1 and beyond Granular Detail Lowerlevel DFDs Level 1 and beyond provide even more detail For instance the Appointment Management process from the Level 0 diagram could be further decomposed into subprocesses like Schedule Appointment Reschedule Appointment Cancel Appointment and Send Appointment Reminders Each of these subprocesses would have its own data flows and interactions with the relevant data stores This level of detail is crucial for developers to understand the specific requirements and build the system accurately
